HEADQUARTERS, DEPARTMENT OF THE ARMY

30 DECEMBER 1998
SAFETY STEPS TO FOLLOW IF SOMEONE IS THE VICTIM OF ELECTRICAL SHOCK.

1. DO NOT TRY TO PULL OR GRAB THE INDIVIDUAL.
2. IF POSSIBLE, TURN OFF THE ELECTRICAL POWER.
3. IF YOU CANNOT TURN OFF THE ELECTRICAL POWER PULL, PUSH, OR LIFT THE PERSON TO SAFETY USING A DRY WOODEN POLE OR A DRY ROPE OR SOME OTHER INSULATION MATERIAL.
4. SEND FOR HELP AS SOON AS POSSIBLE.
5. AFTER THE INJURED PERSON IS FREE OF CONTACT WITH THE SOURCE OF ELECTRICAL SHOCK, MOVE THE PERSON A SHORT DISTANCE AWAY AND IMMEDIATELY START ARTIFICIAL RESUSCITATION.
A lithium-sulfur dioxide (Li-SO\textsubscript{2}) battery used with Battery Box, CY-8523 series contains pressurized sulfur dioxide (SO\textsubscript{2}) gas (rotten egg smell). The gas is toxic, and the battery **MUST NOT** be abused in any way which may cause the battery to rupture.

**DO NOT** heat, short circuit, crush, puncture, mutilate, or disassemble the battery.

**DO NOT USE** any battery which shows signs of damage, such as bulging, swelling, disfigurement, brown liquid in the plastic wrap, a swollen plastic wrap, etc.

**DO NOT** test Li-SO\textsubscript{2} batteries for capacity, except as authorized.

**DO NOT** recharge Li-SO\textsubscript{2} batteries.

**DO NOT** use water to extinguish Li-SO\textsubscript{2} battery fires.

If the battery compartment becomes hot to the touch, if you hear a hissing sound (i.e., battery venting), or if you smell irritating sulfur dioxide gas (rotten egg smell), **IMMEDIATELY TURN OFF** the equipment. Remove the equipment to a well ventilated area or leave the area.

**DO NOT** use a Halon type fire extinguisher on a lithium battery fire.

In the event of a fire near a lithium battery(ies), rapid cooling of the battety(ies) is important. Use a carbon dioxide (CO\textsubscript{2}) extinguisher.

**DO NOT** store lithium batteries with other hazardous materials and keep them away from open flame or heat.
RF energy is present near the antenna during transmission. Except Manpack, maintain at least 30 inches from antenna and personnel during transmission.

**WARNING**

HIGH VOLTAGE
Connectors J1 of the vehicular amplifier-adapter (VAA) and J4 of the RF power amplifier mount (PA mount) have 200 V dc on pin F. Use extreme caution in measuring the voltages on these connectors.

**WARNING**

DO NOT lift the VAA with any component installed. Maximum weight for a one-person lift is 35 lbs.
**WARNING**

HIGH VOLTAGE is present during testing and troubleshooting of the radio sets. DEATH ON CONTACT can result, so observe the following safety precautions:

If possible, work on the equipment only when another person is nearby who is competent in CARDIOPULMONARY RESUSCITATION (CPR) and knows the five safety steps on page a.

Never work on electronic equipment unless there is another person nearby who is familiar with the operation and hazards of the equipment and who is competent in administering first aid. When the technicians are aided by operators, they must be warned about dangerous areas.

Whenever possible, the power supply to the equipment must be shut off before beginning work on the equipment. Take particular care to ground every capacitor likely to hold a dangerous potential. When working inside the equipment, after the power has been turned off, always ground every part before touching it.

Be careful not to contact high-voltage connections or 115 V ac input connections when installing or operating this equipment.

Whenever the nature of the operation permits, keep one hand away from the equipment to reduce the hazard of current flowing through the body.

**DO NOT BE MISLED** by the terms “low voltage” and “low potential.” Voltages/potentials as low as 50 V can cause DEATH under certain conditions.

Remove or tape all personal metal objects (e.g., watches, rings, and medallions) before working on C-E equipment.

For Artificial Respiration, refer to FM 21-11.

---

**HARDNESS CRITICAL PROCESS**

The RT-1523 series of radio sets have been designed to survive the effects of a nuclear explosion. This includes over pressure and burst, thermal radiation, electromagnetic pulse (EMP), and transient radiation effects on electronics (TREE). Those maintenance procedures that are critical in maintaining the nuclear hardness of the radio are marked HCP.
MOBILE OPERATION WITH WHIP ANTENNAS

DO NOT stop your vehicle under power lines.

Maintain mobile communications with your antenna tied down.

Ensure that the protective antenna tip cap is on the end of your antenna.

DO NOT touch or stand within 30 inches (0.75 meters) of a vehicular antenna if it is possible that the RT is keyed.

When operating cross-country, do not place arm, leg, or weapon over the sides of the vehicle. If your antenna accidentally touches a power line, a fatal or serious accident can happen.

If you believe your vehicular antenna may not clear a power line, stop before you get near the power line. Carefully tie the antenna down. You may remove the antenna if necessary to ensure that it does not touch the power line.

Install a stay-down or snap-free antenna clip over the antenna. See TM 11-5820-890-10-1 for details.

Death or serious injury can result:

- When antenna tip caps are not installed on antenna.
- When an antenna that is not tied-down hits a fixed object such as an overhead bridge, tree limb, etc., flying antenna parts might strike nearby personnel.

REPORTING ERRORS AND RECOMMENDING IMPROVEMENTS

You can help improve this manual. If you find any mistakes, or if you know a way to improve the procedures, please let us know. Mail your letter, DA Form 2028 (Recommended Changes to Publications and Blank Forms), or DA Form 2028-2 located in the back of this manual direct to: U.S. Army CECOM, ATTN: AMSEL-LC-LM-LT, Fort Monmouth, New Jersey 07703-5007. A reply will be furnished direct to you.

HOW TO USE THIS MANUAL

OBJECTIVE.

The goal of this technical manual is to provide unit maintenance procedures that are easy to understand and is equally easy to follow when operating in the field.

MANUALS.

Three technical manuals support the unit maintainer:

**TM 11-5820-890-20-1** (Short title: TM 20-1) focuses on SINCGARS radios, both manpack and vehicular configurations, and provides essential information regarding cables, component replacement and repair. By limiting TM 20-1 to this primary focus, the manual is small enough to be carried around by the maintainer during field operations if required.

**TM 11-5820-890-20-2** (Short title: TM 20-2) supplements TM 20-1 with maintenance procedures regarding other system components. These include vehicular intercommunications system (VIC), frequency-hopping multiplexer (FHMUX), control-monitor (C-M), remote control unit (RCU), single radio mount (SRM), FH fill devices, and batteries. Additionally, TM 20-2 includes the maintenance allocation chart and power distribution diagrams. TM 20-2 is necessarily larger than TM 20-1 and it is designed primarily for use under shelter.

**TM 11-5820-890-20-3**, Unit Maintenance Handbook (Short title: TM 20-3) is the third manual. This is a logbook size manual designed to be routinely carried by each unit maintainer while checking out communications systems installed in vehicles and in field locations. The information contained in this handbook is extracted from TM 20-1 and TM 20-2, but the manual's useful size obviously limits the amount of information provided. The guidance found in the handbook is accurate. It is just not as detailed as that found in TM 20-1 and TM 20-2.

Unit maintenance personnel are encouraged to use all three manuals. The handbook is carried on their person for on-site, in the field, troubleshooting and faulty line replaceable unit (LRU) identification. TM 20-1 and TM 20-2 are then used to confirm handbook-based findings, or to extend troubleshooting procedures where the handbook fails to disclose which LRU is faulty.

PRINCIPLES OF OPERATION.

Where appropriate, TM 20-1 and TM 20-2 provide background information of general interest in understanding how the system or component works.

OPERATIONAL CHECKS.

Each chapter of TM 20-1 and TM 20-2, where applicable, contains Operational Checks. This is where the unit maintainer starts to identify the nature of the problem. As these manuals caution, it is important to perform Operational Checks exactly as presented, or false findings can result. The second important application of the Operational Check is its use after LRU replacement, or repair, to verify that the fault has been corrected. The Operational Check for manpack and vehicular radios found in TM 20-3, Unit Maintenance Handbook, are identical to those provided in TM 20-1. Operational checks for other items of equipment are shown in TM 20-2 only.
TROUBLESHOOTING FLOWCHARTS.

Each chapter of TM 20-1 and TM 20-2, where applicable, contains Troubleshooting Flowcharts. Which flowchart to use is determined by the Operational Check. Use of the troubleshooting flowchart then identifies the specific problem and tells the maintainer to replace, or repair, a specific LRU.

The Unit Maintenance Handbook, TM 20-3, contains abbreviated troubleshooting flowcharts called Troubleshooting Guides. Guides are shorter than flowcharts to permit their use in a logbook sized handbook. Experience has shown that by using these abbreviated troubleshooting guides, a unit maintainer is able to correctly identify system problems. When use of the troubleshooting guides fails to properly identify the problem, or there is a question about the accuracy of the problem identification, the unit maintainer should use TM 20-1 or TM 20-2 with their more extensive troubleshooting flowcharts. The purpose of the handbook is to help the unit maintainer when working inside vehicles in the field, but the procedures contained in the handbook may be supplemented with those in TM 20-1 and TM 20-2.

SYSTEM VERSUS COMPONENTS.

The Operational Checks and troubleshooting flowcharts/guides found in TM 20-1, TM 20-2, and TM 20-3 are based upon the requirement to check systems rather than components. For example, a problem with the radio in a vehicle must be checked in the vehicle, not by removing the RT and taking it elsewhere to be checked. Once the vehicular radio system has been checked and a specific LRU identified as faulty, that LRU can be taken elsewhere for further checking. When the radio system being checked includes an AN/VIC-1 (VIC), check first to determine if the fault is in the radio or the VIC. Then troubleshoot the faulty part of the system.

AVOIDING FALSE PULLS.

When properly used, these three TMs offer the unit maintainer the means for accurately identifying nearly all faulty LRUs. The number of problems which can occur in radio systems and the detailed procedures required for accurate identification dictate that manuals must be used even under the most adverse field conditions. Attempts to troubleshoot from memory have proven over and over to result in false pulls, reflecting adversely on the unit maintainer and helping no one. Four sure ways to keep false pulls to an absolute minimum are: (1) start by performing the prescribed Operational Check; (2) use these manuals when troubleshooting; (3) confirm your fault identification by again performing the Operational Check; and (4) use TM 20-1 and TM 20-2 troubleshooting flowcharts to double-check faulty LRUs before evacuating them to direct support (DS) maintenance.

C. Purpose and Use of Equipment. All types of SINCGARS ICOM radio sets use the RT-1523 series as the basic receiver-transmitter. They can operate in single channel (SC) mode or in the frequency hopping (FH) mode. In either mode the RT can receive and transmit voice, and analog or digital data. The RT has a self-test function, retransmit capabilities, and can be remotely controlled. External COMSEC equipment is not required when using the RT-1523 series. Secure communications functions are built into the RT.

1.2. CONSOLIDATED INDEX OF ARMY PUBLICATIONS AND BLANK FORMS,

Refer to the latest issues of DA Pam 25-30 to determine whether there are new editions, changes or additional publications pertaining to the equipment.

1.3. REPORTING EQUIPMENT IMPROVEMENT RECOMMENDATIONS (EIR).

If your series of radio sets needs improvement, let us know. Send us an EIR. You, the user, are the only one who can tell us what you don’t like about the design. Put it on an SF 368 (Product Quality Deficiency Report). Mail it to: US Army CECOM, ATTN: AMSEL-LC-ED-CFO, Fort Monmouth, NJ 07703-5023. We’ll send you a reply.

1.4. MAINTENANCE FORMS, RECORDS, AND REPORTS.

a. Reports of Maintenance and Unsatisfactory Equipment. Department of the Army forms and procedures used for equipment maintenance will be those prescribed by DA Pam 738-750 as contained in Maintenance Management Update.

b. Reporting of Item and Packing Discrepancies. Fill out and forward SF 364 (Report of Discrepancy (ROD)) as prescribed in AR 735-11-2/DLAR 4140.55/SECNAVIST 4355.18/AFR 400-54/MCO 4430.3J.

1.5. DESTRUCTION OF ARMY ELECTRONICS MATERIEL.

Destruction of Army electronics materiel to prevent enemy use shall be in accordance with TM 750-244-2.

1.6. PREPARATION FOR STORAGE OR SHIPMENT.

Before placing equipment in administrative storage, Operational Checks will be performed and necessary repairs made. Remove batteries prior to storage. When removing equipment from administrative storage, an Operational Check will be performed to assure operational readiness.

1.7. NOMENCLATURE CROSS-REFERENCE LIST.

This list contains common names used in this manual in place of the official nomenclature.

* RT-A is in the lower position of VAA; RT-B is in upper position of VAA.
SECTION II

PRINCIPLES OF OPERATION

1.8. GENERAL.

This section covers the principles of operation for the RT-1523 series of radio sets and ancillary equipment.

NOTE

RT-A designates bottom RT in VAA, and RT-B designates top RT in VAA

1.9. DC POWER INPUT AND DISTRIBUTION.

a. Battery Power for Manpack Radio. The primary battery, BA-5590/U (non-rechargeable), BB-590/U (NiCad, rechargeable), or BB-390 (Nickel Metal Hydride, rechargeable), is used to provide power. These batteries are used to provide 10.5 to 15.5 V dc through the system connector (P1) on the back of the RT Battery box CY-8523 series is provided to hold the battery to the RT.

b. Vehicular Power. The vehicular battery provides an input voltage that may vary from 22 to 32 V dc. The battery is connected to the mounting base by a power cable. In some vehicles, the cable is connected to a terminal block which is connected to the battery.

c. Power Distribution in Mounting Base (MB) MT-6352 Series. The 22 to 32 V dc enters the MB on pin B of connector J1 and is wired to pin B of J2, J3, and J4. Connector J2 is the power out connector and provides 22 to 32 V dc to either a PA mount or other peripheral equipment. Connector J3 or J4 supplies 22 to 32 V dc to be used by the LS-671 loudspeaker and intercom.

1.9. **DC POWER INPUT AND DISTRIBUTION.** Continued

d. **Power Distribution in Vehicular Amplifier-Adapter (WA), AM-7239 Series.** The 22 to 32 V dc from J5, pin B, of the MB, enters the VAA through P1, pin B. P1, pin B is connected to CB1, which provides over-current protection for the power supply. In the AM-7239 version of VAA, a shorting bar is used on TB2 to bypass the contacts of relay K1 for LOCAL power control. The shorting bar is removed for REMOTE power control. In the AM-7239A, a shorting jumper is moved for LOCAL or REMOTE operation. In the AM-7239B,C,D and E, a switch is used for LOCAL or REMOTE operation.

DS1 will light at the AM-7239 if power is present. DS1 will light at AM-7239A if power is present at output contact of relay K1. DS1 will light at AM-7239B,C, and E if power is present on 13 V dc line.

In the AM-7239E, transient protection is provided by the Transient Protect CCA (A3A1). The transient protection circuit controls the gates of parallel field effect transistors (FET) Q7, Q8 which are in series between the power input and the input to power supply Al.
1.9. DC POWER INPUT AND DISTRIBUTION. Continued

AM-7239A/D Power Distribution

AM-7239B/C Power Distribution
1.9. DC POWER INPUT AND DISTRIBUTION. Continued

AM-7239E Power Distribution

- REMOTE/LOCAL Power Control Operation. There are six models of VAA: AM-7239 SERIES. The principal difference among these models is in the method of selecting LOCAL and REMOTE operation. The AM-7239 uses a shorting bar which is changed by removing a cover panel on the side of the VAA. The AM-7239A uses a shorting jumper, also located behind a cover panel. The AM-7239B,C and D uses a Local/Remote switch which is visible to the left of the RT-B J7 system connector. The AM-7239E uses a Local/Remote switch which is to the right of DS1. The following illustrations demonstrate these differences.

1) Placing VAA into Local or Remote Mode (AM-7239):

<table>
<thead>
<tr>
<th>MAINTENANCE REQUIREMENT:</th>

</tbody>
</table>
1.9. DC POWER INPUT AND DISTRIBUTION. Continued

f. Power Supply Module. The 22 to 32 V dc is applied to power supply Al. This power supply is a dc-to-dc converter which takes the 22 to 32 V dc and produces the following voltages:

- 6.5 to 7.25 V dc
- 12.6 to 13.4 V dc
- 180.0 to 220.0 V dc

These voltages are used by RT-A, RT-B, RCU-A, RCU-8, control-monitor, and power amplifier installed on the VAA.

g. Power Distribution in Power Amplifier Mount (PA mount) MT-6353. The 22 to 32 V dc enters the PA mount through J1, pin B from J2, pin B of the MB. The 22 to 32 V dc used to energize the K1 relay enters the PA mount through J1, pin C from J2, pin C of the MB. When CB1 of the VAA is set to ON, 22 to 32 V dc will be applied to J1, pin C of the PA mount causing the K1 relay to energize. This allows the 22 to 32 V dc at J1, pin B to be applied to power supply Al of the PA mount when CB1 is set to ON. This, in turn, allows DS1 to light.

h. Power Distribution in the Loudspeaker-Control Unit LS-671. The loudspeaker-control unit LS-671 controls the power to the radio with its ON/OFF switch if the VAA is set to REMOTE.

The primary power enters the MB at connector J1, pin B. From here it is distributed to connectors J3 and J4, pin B. A loudspeaker cable carries the dc to the LS-671 system connector J1, pin B. If the loudspeaker ON/OFF switch is in the ON position, the dc power from pin B is connected to pin D. The loudspeaker cable carries the dc back to the MB connectors J3 and J4, pin D. Pin D of the MB is connected to the MB system connector J5, pin E. This is a direct connection to VAA system connector P1, pin E.

Dc power on P1, pin E of the VAA energizes relay K1 allowing dc power to exit on pin C. Pin C of the MB distributes the dc power to connectors J3 and J4. The loudspeaker cable carries the dc through LS-671 system connector J1, pin C, to power the audio amplifier.
1.1. **RECEIVE SIGNAL PATH.**

a. **RF Signal.** The RF signal is picked up by an antenna.

  Manpack antennas connect directly to the RT ANT connector J1. The RT contains an impedance network that matches the RT to the AS-3683 antenna. The AS-4266A contains its own matching network.

  Vehicular antennas use an RF cable to transfer RF energy to the RT. The antenna base and RT have impedance networks to match the 50 ohm RF cable.

b. **Analog Voice Receive Signals.** RT voice signals are limited to the bandwidth of 300 Hz to 3 kHz. The analog signal is amplified and sent to the AUD/DATA, AUD/FILL, and rear system connector P1.

   **AM-7239, AM-7239A, AW-7239B only**

   Audio from AUD/DATA is taken by the W4 cable to the VAA. In the VAA, audio is amplified and sent to connector J6 (SPKR) and VAA system connector P1 as variable audio. The RT-A and RT-B audio are summed in the VAA for the speaker connector J6. A muting line is provided at MB connector J2 for external muting of RT-A or RT-B audio at J6.

   From RT-A or RT-B rear system connector P1, audio is sent to the VAA system connector P1 as fixed level audio.

   High level audio lines are used by the intercom. The amplification of the audio for these lines is provided by the radio system. For AM-7239, AM-7239A, and AM-7239B this is the amplified video mentioned in the box above. For other VAAs this is from the fixed level audio at RT P1, amplified by the VAA. The “A” audio enters the MB system connector J5, pin F and exits at connector J3, pin H. The “B” audio enters MB system connector J5, pin N and exits at connector J4, pin H.

   Low level audio lines are used by the intercom and the LS-671. The amplification of this audio is provided by the peripheral equipment. The audio is from RT P1. The “A” audio enters the MB system connector J5, pin H and exits at connector J3, pin K. The “B” audio enters the MB system connector J5, pin P and exits at connector J4, pin K. Detailed information on the receive paths of the intercom and LS-671 is provided in TM 20-2.

c. **Analog Digital (AD1 or TF) Signals.** Analog data can be processed using either AD1 or TF. When the RT is set to AD1, the analog data signal follows the audio receive path. When TF is used, the analog data is converted into 16 kbps digital data by the transmitter. The receiver converts it back into analog data.

d. **Squelch Circuit.** A tone squelch circuit is used to prevent the reception of noise when a signal is not being received. This allows the RT-1523 series and AN/VRC-12 (NATO FM radio) series radios to communicate with each other.

1.11. **TRANSMIT SIGNAL PATH.**

a. **Keying Circuit.** The transmitter is “keyed” when the handset PTT switch is pressed. This places a ground on the handset audio connector pin C. For the AM-7239C and later VAAs and all manpack radios, the handset is connected to the RT-A or RT-B AUD/DATA pin C. For AM-7239B and earlier, the handset is connected to the VAA and is sent to the RT AUD/DATA connector, pin C, via the W4 cable.

   A PTT ground can also be generated by the LS-671. MB J3 controls RT-A by passing the ground from pin S to VAA P1, pin K. For AM-7239C and later VAAs the ground is routed to RT system connector P1, pin S on RT-a. For AM-7239B and earlier, VAA P1, pin K is connected to the 1 watt audio amplifier in the VAA. The 1 watt audio amplifier places the ground on pin C of AUD/DATA connector J5. The ground is sent through the W4 cable, pin C, and then to the RT-A AUD/DATA, pin C.
1.11. TRANSMIT SIGNAL PATH. Continued

MB J4 controls RT-B by passing the ground from pin S to VAA P1, pin S. For AM-7239C and later VAAs the ground is routed to RT system connector P1, pin S on RT-B. For AM-7239B and earlier, VAA P1, pin S is connected to the 1 watt audio amplifier in the VAA. The 1 watt audio amplifier places the ground on pin C of AUD/DATA. The ground is sent through the W4 cable, pin C, then to RT-B AUD/DATA, pin C.

When the LS-671 is installed, the connected handset will provide the necessary ground to transmit. Either RT-A or RT-B will be controlled depending on whether the LS-671 is connected to MB J3 or J4. The connection is made by a loudspeaker cable (CX-13292).

b. Analog Voice Transmit Signals. Audio signals are generated in the handset when the PTT switch is pressed. These signals are on pin D of the handset and are passed directly to manpack and AM-7239C and later configuration RTs, or to VAA J2 or J3 for AM-7239B or earlier configurations. For AM-7239B and earlier configurations, VAA J2 and J3 are wired in parallel to connectors J4 and J5, and connect to the RT’s via W4 cables.

Audio signals are also generated at the LS-671. Cables pass these signals to MB J3 or J4, pin U.

<table>
<thead>
<tr>
<th>AM-7239B and earlier</th>
</tr>
</thead>
<tbody>
<tr>
<td>J3 audio enters the VAA system connector P1, pin M. The signal is present at the VAA J3, pin D and J5, pin D. Connector J3 is where the RT-A handset is placed. Connector J5 is connected to the RT-A AUD/DATA, pin D by a W4 cable. The audio is then processed and transmitted.</td>
</tr>
<tr>
<td>J4 audio enters the VAA system connector P1, pin U. The signal is present at the VAA J2, pin D and J4, pin D. Connector J2 is where the RT-B handset is placed. Connector J4 is connected to the RTB AUD/DATA, pin D by a W4 cable. The audio is then processed and transmitted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>AM-7239C and later</th>
</tr>
</thead>
<tbody>
<tr>
<td>J3 audio enters the VAA system connector P1, pin M. J4 audio enters the VAA system connector P1, pin U. The audio is routed through the VAA to RT-A and RT-B system connectors P1, pin E. The audio is then processed and transmitted.</td>
</tr>
</tbody>
</table>

c. Whisper (WHSP) Control. The RT whisper mode is selected, by pulling out the RT WHSP control for RT1523D and earlier, or by the RT menu for RT-1523E. When whisper mode is selected, an internal audio preamplifier is turned on. The microphone circuit now additionally amplifies the whispered voice. This allows the use of the radio in situations where the user does not wish to be overheard.

d. Analog Data Modulation. Data devices are connected in place of the handset on the VAA (AM-72398 or earlier) or RT (AM-7239C or later). The handset is then connected to the RT AUD/FILL. A wide range of data signals can be transmitted. The data is frequency modulated on the RF carrier and transmitted. In AD1, all incoming FSK signals are treated the same as voice signals. In TF (TACFIRE) the FSK tones are changed to a 16 kbps signal.

For RT-1523B and earlier, the RT needs a ground applied to pin F of the AUD/DATA connector for TF mode. The ground informs the RT to go to the analog data mode. Pin F is grounded by an FSK detector circuit in the VAA for the vehicular radio. Pin F is grounded by an adapter cable (CX-13308/VRC) for the manpack radio.

e. Digital Data Modulation. Data devices are connected to RT AUD/DATA. The handset is then connected to RT AUD/FILL. A number of data rates are available for selection: 600 bps, 1.2 kbps, 2.4 kbps, 4.8 kbps, and 16 kbps (RT- 1523A/B ). For RT- 1523C/D/E the following data rates are available: 600,1200,2400,4800,16000,1200N, 2400N, 4800N, 9600N, PCKT, and RS-232. When low data rates are used, the error correction coding allows a greater communication range and increased message accuracy.
1.11. TRANSMIT SIGNAL PATH. Continued

f. **RF Forward Power.** The RT has four RF power settings L, M, HI, and PA. See Equipment Data for power levels. When the AS-3683 manpack antenna is used with the RT, an internal impedance matching network matches the antenna impedance to that of the RT. The vehicular antenna and the RT have impedance matching networks to match the 50 ohm RF cable.

g. **RF Reverse Power Protection.** No damage shall occur when transmitting into a VSWR between 1 and infinity. The RT will not be harmed if it is keyed without an antenna connected. When the VSWR circuit detects a VSWR greater than 5:1, it interrupts (disables) the handset sidetone.

1.12. FREQUENCY HOPPING OPERATION.

a. **General.** The RT-1523 series contains circuitry which provides encryption and decryption for Communication Security (COMSEC). Transmission security is provided by frequency hopping, with the frequency determined by the variables, including time, which are loaded into the RT. When all data is loaded into the RT, the radio can change frequencies (HOP) more than one hundred times a second.

b. **Frequency Hopping Variables.** The process of frequency hopping requires four data elements or variables. They are: (1) a hopset, which is a group of frequencies (30 to 87.975 MHz) that the radio uses; (2) a TRANSEC (TSK) key, which is used in selecting the frequency hopping sequence; (3) a NET ID, a three digit number from 000 to 999 that fixes the hopping start point; and (4) sync time, which must be within +/- 4 seconds of each other.

c. **RF Circuitry.** The RT uses the same RF circuits for both Single Channel (SC), and Frequency Hopping (FH). In the FH mode, the intelligence is converted into digital data of 16 kbps. The digital data is then distributed across the frequencies of the hopset. The distributed signal is then processed by the RF amplifiers and spread over a number of RF frequencies prior to being transmitted. The receiver, however, must be able to track with the transmitter in order to decipher the digital message of the frequency hopping transmitter. The transmitter provides the receiver with certain signals that enable the receiver and transmitter to synchronize with each other. With the receiver and transmitter in sync, the receiver converts the message back to either voice or data.

1.13. TIME MANAGEMENT.

a. **General.** Before the RT-1523 series radio can operate in a frequency hopping net, it must have sync time entered. All RTs in a net must have the same net ID, TRANSEC key, hopset, and FH sync time within +/- 4 seconds in order to communicate with each other. If the sync times are different, the RTs cannot communicate in FH mode.

b. **Timing Restrictions.** There are different operating time restrictions for the RT. The time restrictions apply to different operating modes as listed below.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Time Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active in-net usage</td>
<td>+ 4 seconds</td>
</tr>
<tr>
<td>Passive late net entry</td>
<td>+ 1 minute</td>
</tr>
<tr>
<td>Use of ERF capability</td>
<td>+ 1 hour (RT- 1523)</td>
</tr>
<tr>
<td></td>
<td>100 days (RT- 1523A/1523B/1523D and 1523E)</td>
</tr>
</tbody>
</table>

c. **Base FH Sync Time.** If the FH sync time is entered with the front panel keyboard, all clocks of the RT are set to the base FH sync time entered through the keyboard. If the FH sync time is entered by ERF, the following will occur:
1.13. **TIME MANAGEMENT.** Continued

When nets are inactive (net opening):

**COLD START**

FH sync time transmitted by ERF becomes the new base FH sync time at the receiving radio.
All clocks of the receiving RT are set to the new base FH sync time.

**HOT START**

FH sync time is entered manually via keypad or electronically by connection to an ANCD or PLGR.

When nets are active (net updates):

FH sync time transmitted by ERF replaces the FH sync time of the channel in which the ERF is stored.
The base FH sync time of the receiving RT is not altered.

1.14. **RT MAIN PANEL DISPLAYS.**

RT-1523 through RF-15230

a. **General.** There are three main panel displays.

b. **SIG Display.** In the receive mode, the SIG display reads the relative strength of the received signal. The stronger the RF signal, the higher the display will read. When transmitting, the SIG display indicates the RF power output. In LO, the display lights bars 1-2, in M, bars 3-4, and in HI, bars 5-6. In PA, all 6-7 bars of the SIG display light.

c. **RT Display.** This display shows the operator indications such as: the single channel operating frequency, net ID, COMSEC key, data rate, battery life indication, and sync time. Some versions of the RT indicate traffic on the net by placing an M in the display. When a FAIL message is displayed, there is a failure in the RT.

d. **HUB Display.** The HUB is used to retain internal memory when the RT is in standby operation and when the main power or main battery fails or is removed. The HUB display flashes on and off when HUB power is low and remains on continuously when the HUB is spent or removed.

---

RT-1523E

a. **General.** The RT-1523E has a single front panel LCD display. It has a backlight which can be turned on and off from the keypad. It is organized in three regions.

b. **Right Side.** At the right side are two indicators: the top one is a dot which indicates power is present and the bottom one is “WHSP” when the whisper mode is activated.

c. **Top Row.** There are five indicator across the top from left to right: a vertical bargraph signal strength meter, a transmit power level setting indicator, a FH mode indicator, a channel indicator and a COMSEC mode indicator.

d. **Bottom Row.** A second row consists of a 13-character free-text region which displays operator indications such as: the single channel operating frequency, net ID, COMSEC key, data rate, battery life indicator, and sync time. It also displays a menu for setting volume, channel, power level, FH mode, and COMSEC mode.
1.15. **RT SELF-TEST (RT-1523 THROUGH RT-152313).**

a. **RT Self-Test.** The RT self-test is selected by setting the FCTN switch to the TST position. The displays and audio should be as shown below. Some versions of the RT will show “FAIL 5” if self-test is run with COMSEC set to PT. Setting COMSEC to CT should result in a display of “GOOD”.

![RT Self-Test Displays and Audio](image)

The RT display is the first section tested in self-test. The first display is “E  C.” The letter “E” shows that the ECCM module is present. The letter “C” shows that the COMSEC module is present. If either module is absent, its letter in the display is replaced by a dash (-). The next display checks the display elements. All the dots in each digit of the display are lit. The SIG display bars are lit in sequence. The HUB display is also lit. After the display is checked, the RT continues its self-test. The receive path is checked at eight frequencies in SC mode and two frequencies in FH mode. As a result of the receive tests, there are 10 short bursts of unsqueched rushing noise which can be heard in the handset. However, because these are so quick and close together, they are difficult to count. At the end of a successful self-test, a beep can be heard in the handset, and the display will read “GOOD”.

**FAILURE- Codes.** If a failure occurs, displays on the RT are interpreted as follows:

- FAIL 1: Internal RT Failure Receive
- FAIL 2: Internal RT Failure Data Rate Module
- FAIL 3: Internal RT Failure ECCM
- FAIL 4: Internal Failure Two Wire
- FAIL 5: COMSEC Failure/RT not in CT
- FAIL 6: SNAP Test or Internet Controller/ FHMUX Failure
- FAIL 7: Internal RT Failure Routing Module
- FAIL 8: internal RT Failure Routing Module

b. **RT SELF-TEST (RT-1523E).**

a. **RT SELF-Test.** The RT self-test is divided into two parts: normal user self-test and detailed maintenance test. Normal user self-test is initiated by setting the FCTN switch to TST. The detailed maintenance is for Direct Support maintenance only.

b. **Failure Codes.** The following detailed maintenance failure code is applicable to unit maintenance:

- FAIL SNAP: SNAP Test or Internet Controller/FHMUX Failure
1.17. **POWER AMPLIFIER.**

a. **Power Output.** The RF power amplifier is used to extend the transmission range of the RT. The amplified RF output from the PA is a nominal 50 watts, but may vary from 30 to 70 watts. On the RT, in the PA setting, a nominal 4 watts is sent from the RT J1 to the PA J2, then amplified and fed to the antenna via the PA J1. In LO, M, or HI, the output of the RT passes through the PA with no amplification and is output to the antenna.

b. **RF Power Amplifier Keying Circuit.** The PA is keyed by the RT. When the PTT switch on the handset is pressed, the RT is keyed by placing a ground on pin C of RT AUD/DATA connector. When RF PWR is set to PA and the RT is keyed, 6.75 V dc is placed on RT, P1, pin H. The presence of 6.75 V dc on PA, P1, pin N, keys the PA. A power level signal is generated and sent to the RT signal display. All bars of the signal display light. The RT selects the proper PA filter. Failure of the RT to select the proper band will cause the PA to fail to transmit.

c. **RF Power Output Filtering.** The PA is a linear amplifier across the frequency band of 30 to 87.975 MHz. The PA has three sets of filters which are selected by the RT.

<table>
<thead>
<tr>
<th>PA FILTER</th>
<th>OPERATING FREQUENCY (MHZ)</th>

</tr>
<tr>
<td>B</td>
<td>43.0 to 61.4</td>
<td>R</td>
</tr>
<tr>
<td>C</td>
<td>61.4 to 88.0</td>
<td>M</td>
</tr>
</tbody>
</table>

d. **Voltage Standing Wave Ratio (VSWR).** VSWR is the relative value of forward to reverse power. Any of these faults may cause high reflected power:

- Use of an old VRC-12 antenna or components
- Antenna elements broken, dirty or corroded
- Lower antenna element connector open
- Defective mounting base
- Rusty antenna base mounting bolts
- Loose or missing ground straps
- Wrong type RF cable installed (75 ohm data cable)
- Open RF cable grounds

The PA has a VSWR detector used to measure the reflected voltage. It is compared to the forward voltage to determine the VSWR. When this ratio exceeds 5:1, the PA RF output is automatically reduced to a safe level. The RF test set can be used to measure RVS PWR. When the 5:1 VSWR is reached, RT sidetone is disabled (except with the AM-7238B/VRC RF PA).

e. **PA Mount.** Some radios use a second PA in a separate mount. The mount is cabled to the VAA, where internal wiring connects the PA mount to RT-B. Cable CX-13303 is used to provide dc power, and CX-13291 is used to pass control signals between the RT and PA.
SECTION III

PRINCIPLES OF MAINTENANCE OPERATION

1.18. USE OF MAINTENANCE ALLOCATION CHART (MAC). (See ™ 20-2)

The MAC gives you the authority and responsibility for doing maintenance tasks on the RT-1523 series radio and ancillary equipment. There are 12 maintenance functions: inspect, test, service, adjust, aline, calibrate, remove, install, replace, repair, overhaul, and rebuild. You will only do these six: inspect, test, service, remove, install, and replace. These functions are marked with an “0” in the maintenance category column.

1.19. UNSCHEDULED MAINTENANCE.

There is no scheduled (preventive) unit maintenance for the RT-1523 series radio. Maintenance will be performed only when the equipment fails.

1.20. TROUBLESHOOTING.

a. Procedure. The first step is to identify the problem. That is done by performing the prescribed Operational Check, which will locate the fault or specify a Troubleshooting Flowchart to use.

b. Flowchart Symbols. The following standard symbols are used in the flowcharts. Become familiar with these symbols so that you can quickly troubleshoot your equipment. Read the explanation and be familiar with each so that you can readily use the flowcharts.

Test Procedures Start. Indicates start of the test procedure.

Test Procedure Flow Line. Indicates direction of the procedure flow.

Test Procedure instruction. Gives instructions for doing a specific test.

Decision. Indicates that a decision must be made (YES or NO) to answer a question about the previous test. Path taken depends on the answer (YES or NO).
1.20. **TROUBLESHOOTING.** Continued

**Connector.** Directs user to an entry point on another sheet in the same chart. Contains an entry number and sheet number that are the same as the entry number and sheet number found on another sheet in the same chart.

![Connector Illustration]

**Notes Column.** Presents critical information. States cautions and warnings that must be observed when doing a test. Has additional data as to what to do or where to go after that step in the testing. Provides references to appropriate circuit diagrams.

**Connector Illustrations.** Front views of connectors are placed accordingly to give the maintainer a visual reference when measuring resistances between pins.

**Helpful Hints.** When taking measurements, remember that a connector’s pin numbers are mirror images of those on the connector from which it was removed. Whenever possible, use a chassis ground instead of a pin ground. This will allow you greater flexibility when taking measurements and can prevent shorting the equipment.

1.21. **POST-REPAIR USE OF OPERATIONAL CHECK.**

When the bad LRU has been found, inspected, and replaced, repeat the Operational Check to ensure that the system is in fact operational.

1.22. **TYPICAL SC TEST SETUP.**

For testing RF in SC mode, use the following test setup for short range radios:

![Short Range Test Setup Diagram]

* INDICATES ANTENNA DISCONNECTED

Use the following test setup for long range radios:

![Long Range Test Setup Diagram]

* INDICATES ANTENNA DISCONNECTED
SECTION IV

PREPARATION FOR STORAGE OR SHIPMENT

1.23.  GENERAL.

This section provides steps for packing the RT-1523 series radio. The radio will be properly packed before placing in storage. All PMCS will be done prior to storage.

CAUTION

Remove all batteries from equipment before storage or shipment. Ruptured cells will spill corrosive chemicals into electronic circuits.

1.24.  SPECIAL PROCEDURES.

The RT-1523 series is a controlled cryptographic item (CCI). Remove the HUB battery. Refer to TB 380-40-22 for procedures to prepare for shipment.

There is no need for special preservation, packaging, packing, or marking. Under extreme climatic conditions, corrosion-preventive compounds, moisture barriers, and/or desiccant material may be required.

1.25.  ADMINISTRATIVE STORAGE.

a.  General. Administrative storage is the placement of organic equipment in a limited care and preservation status for short periods of time, reviewed every 6 months to revalidate the requirement.

b.  Procedures. Equipment placed in storage must be capable of being restored to a working state within 24 hours. Before storing equipment, apply all mandatory MWOs. Ensure that only equipment rated OPERATIONALLY READY is placed in storage. Refer to AR-750-1.

   (1) Tools and Materials: Tool Kit, Electronic Equipment TK-101/G
                              Equipment carton and packing material
                              Tape

   (2) Packing: Secure dust covers on component (6) connectors.
                Place component (6) in carton (2).
                Install packing (5).
                Replace manuals (4).
                Close flaps (1, 3) and seal carton with tape.

   (3) Marking: Mark carton with nomenclature, model identification, and serial number of radio component.

   (4) Disposition: Place carton in secure storage area.
1.25. **ADMINISTRATIVE STORAGE.** Continued

1.26. **INTERMEDIATE STORAGE.**

a. **General.** Intermediate storage is the placement of organic equipment in storage for less than 180 days.

b. **Procedures.** Pack equipment for administrative storage.

   (1) Tools and materials: Tool Kit, Electronic Equipment TK-101/G
   Shipping cartons
   Waterproof barrier wrap

(2) Packing:
Place waterproof barrier wrap (1) around equipment carton (2) and seal.
Place equipment carton in outer carton (3).
Close flaps and seal.

(3) Marking:
Mark carton with nomenclature, model identification, and serial number of radio component.

(4) Disposition:
Place carton in secure storage area.
CHAPTER 2
MANPACK RADIO

2.1. ASSEMBLY INSTRUCTIONS.

The following steps explain how to assemble the manpack radio set.

Tools:

2.2. OPERATIONAL CHECK.

The following Operational Check for Manpack Radios, identical in both TM 20-1 and TM 20-3 (Unit Maintenance Handbook), is used to identify what is wrong with a Manpack Radio and determine what corrective actions needs to be taken at Unit Maintenance Level. After corrective action has been taken, this Operational Check is used a second time to verify that the radio is fully operational*. As a minimum, perform a communication check.

Corrective actions are either specifically stated (for example, Replace RT), or the Unit Maintainer is advised of the most likely symptom to pursue. When the Operational Check identifies a symptom for problem that requires further investigation, the Unit Maintainer is referred to a Troubleshooting Flowchart (TS CHART) which is used to isolate the fault.

In short, use of the Operational Check either identifies the problem and specifies action to be taken, or cites a symptom and refers the Unit Maintainer to a specific Troubleshooting Flowchart. Use of the Operational Check after corrective action has been taken helps to ensure that the Manpack Radio is in fact operational, and such use greatly reduces the possibility of false pulls at Unit Maintenance Level.

* Operational Check procedures must be performed as shown and in the order given.

<td>NO: Go to STEP 3</td>
</tr>
<tr>
<td></td>
<td>YES: Replace RT</td>
<td></td>
</tr>
</tbody>
</table>

** After completing a corrective action, continue with next Operational Check step.

*** See [TM 11-5820-890-10-8] for operator procedures. HRCRD is non reparable and should be used until non Functional.
2.2. **OPERATIONAL CHECK.** Continued

**STEP 3. RT SELF-TEST:**

<table>
<thead>
<tr>
<th>STEPS TO PERFORM</th>
<th>CHECKS TO MAKE</th>
<th>ACTIONS TO TAKE</th>
</tr>
</thead>
</table>
| **3.1** Set RT  
COMSEC to CT  
FCTN to TST | N/A  
RT passes self-test? | N/A  
YES: Go to Step 3.2  
NO: Disconnect antenna and HS from RT, rerun self-test |
|  |  | RT then passes self-test? |
| **3.2** Set RT:  
FCTN to LD  
CHAN to MAN  
DATA to OFF | N/A  
N/A  
RT display reads 30000? | N/A  
YES: Continue ↓  
NO: Replace RT  
COMSEC alarm sounds? (RT-1523/A/B/D)  
Steady tone heard? (RT-1523C/E) | YES: Go to Step 3.3  
NO: Replace RT |
| **3.3** Press PTT twice | Steady tone is heard | YES: Go to STEP 4  
NO: Replace RT |

**STEP 4. LOAD CHECKS:**

<table>
<thead>
<tr>
<th>STEPS TO PERFORM</th>
<th>CHECKS TO MAKE</th>
<th>ACTIONS TO TAKE</th>
</tr>
</thead>
</table>
| **4.1** Load RT with SC frequencies:  
Chan 1: 41000  
Chan 2: 54000  
Chan 3: 75000 | SC frequencies load properly? | YES: Go to Step 4.2  
NO: Replace RT |
| **4.2** Load RT with COMSEC and FH data.* Note: Set RT controls to CT, LD, FH, MAN, and DATA OFF (Clear COMSEC alarm by pressing PTT twice, if required) | RT accepts fill? | YES: Go to Step 4.3  
NO: Go to TS Chart 1 |
| **4.3** Set RT to STBY | RT shuts down properly? | YES: Go to Step 4.4  
NO: Replace RT |
| **4.4** Remove Main Battery  
Replace after 1 min.  
Set FCTN to SQ ON | N/A  
N/A  
RT retains COMSEC, FH, and SC data in both FH and SC modes? | N/A  
YES: Go to Step 4.5  
NO: Replace RT |
| **4.5** Set RT FCTN to LD  
Load Battery Life Condition | N/A  
Battery Life Condition loads properly? | N/A  
YES: Go to STEP 5  
NO: Replace RT |

*If using an Automated Net Control Device (ANCD), follow ICOM Fill procedure to load COMSEC keys and FH data in all 6 channels. Otherwise, load COMSEC keys and FH data in Channels 1, 2, and 3.*
2.2. OPERATIONAL CHECK.  Continued

STEP 5. TRANSMITTER CHECKS:

REPLACE RCU.

YES

REPLACED RT IS BAD.
CHAPTER 3
VEHICULAR RADIO CONFIGURATIONS

3.1. OPERATIONAL CHECK.

The following Operational Check for Vehicular Radio Configurations, identical in both TM 20-1 and TM 20-3 (Unit Maintenance Handbook) is used initially to identify what is wrong with a vehicular radio system and determine what corrective action needs to be taken at Unit Maintenance. After corrective action has been taken, this Operational Check is used a second time to verify that the system is fully operational.

The Unit Maintainer, using this Operational Check, determines if FIT-A, FIT-B, or both are to be checked, and whether the problem radio is short range or long range. The Unit Maintainer also determines which other items of ancillary equipment such as intercommunications systems, loudspeakers, and control-monitors, are involved and skips those Operational Check actions that do not apply. Wiring diagrams of Short Range RT-A and RT-B, plus Long Range RT-A and RT-B, are provided at the front of the Troubleshooting section (Paragraph 3.2) for ease of reference.

In checking vehicular radio systems that contain a Vehicular Amplifier-Adapter (VAA), the Unit Maintainer must determine which of the five current models is present: AM-7239 SERIES. The principal difference among these models is in the method of selecting LOCAL and REMOTE operation. The AM-7239 uses a shorting bar which is changed by removing a cover panel on the side of the VAA. The AM-7239A uses a shorting jumper, also located behind a cover panel. The AM-72396, AM-7239C and AM-7239D uses a LOCAL/REMOTE switch which is visible to the left of the RT-B J7 system connector. AM-7239E uses a LOCAL/REMOTE switch which is visible to the right of CB1. Chapter 1 provides both explanations and graphics of these differences (refer to paragraph 1.9.e). Whenever necessary, Operational Checks and Troubleshooting Flowcharts/Guides provide separate actions by VAA model.

Corrective actions are either specifically stated (for example, Replace RT), or the Unit Maintainer is advised of the Troubleshooting Flowchart (TS CHART) to use. Use of the Operational Check after corrective action has been taken helps to ensure that the vehicular radio is in fact operational, and greatly reduces the possibility of false pulls at Unit Maintenance.
3.1. **OPERATIONAL CHECK.** Continued

**IMPORTANT POINTS TO REMEMBER IN USING THE OPERATIONAL CHECK**

- When an Operational Check step involves an item of equipment which is not used in the system being checked, skip the appropriate portion of that step and continue to the next step.
- It is important that Operational Check steps be performed as stated and in the order presented in the manual.
- If the vehicular radio system being checked includes an AN/VIC-1 (VIC) intercom, determine as early as possible whether the problem is in the VIC or the radio; then troubleshoot that part of the system. If you need to troubleshoot the VIC, see Chapter 2 TM 20-2.
- Once you have completed the Operational Check, and the problem appears to be solved, make a communications check (unless prohibited by unit SOP or the tactical situation) and repeat the Operational Check to ensure the system is completely operational.

- When removing or installing components ensure VAA CB1 is in OFF position.
- Do not accept power outputs less than those specified.
- Before beginning an Operational Check on any vehicular radio system, verify that you have good power with engine running and engine off. Obtain assistance of unit vehicle mechanic as required.

---

**OPERATIONAL CHECK FOR VEHICULAR RADIOS**

*(Short Range RT-A, RT-B, and Long Range RT-A, RT-B)*

**STEP 1. PREPARATION:**

<table>
<thead>
<tr>

NO: Go to TS Chart 25 |

(End of Operational Check for Vehicular Radios; See TS Chart 22 if having trouble with transmitting / receiving data devices.)
3.2. TROUBLESHOOTING FLOWCHARTS.

This paragraph provides the unit maintainer with four general use schematics (Short Range FIT-A; Short Range FIT-B; Long Range RT-A; and Long Range RT-B) plus 22 Troubleshooting Charts. The unit maintainer is directed to one or more specific Troubleshooting Chart from the Operational Check. Use of Troubleshooting Charts prior to application of the Operational Check, represents poor use of unit maintainer time, can result in false pulls, and is strongly discouraged.

After application of the Operational Check and one or more Troubleshooting Charts, if required, the unit maintainer will perform the prescribed LRU replacement or repair. To ensure that the system is completely operational following such maintenance action, the unit maintainer again applies the complete Operational Check. If the system then passes all steps of the Operational Check, the system may be declared fully operational and returned to service.
3.2. TROUBLESHOOTING FLOWCHARTS. Continued

Short Range Radio, RT-A
(AN/VRC-87/88A)

NOTES:

1. If the splitter cable (CX-13417) is not present, the loudspeaker cable (CX-13292) may be connected directly to J3, or the vehicle intercom may be connected to J3 via the VIC interface cable (CX-13313).

2. CX-13292 and CX-13300 may be connected to either mating connector of CX-13417.

3. AM-7239C/D/E cannot be connected to a LS-454 speaker.
3.2. TROUBLESHOOTING FLOWCHARTS. Continued

Short Range Radio, RT-B
(AN/VRC-1/89A/91A)

NOTES:
1. If the splitter cables (CX-13417) are not present, the loudspeaker cables (CX-13292) may be connected directly to J3 and J4, or the intercom cables (CX-13300) may be connected to J4 and to J3 via VIC interface cable (CX-13313).
2. CX-13292 and CX-13300 may be connected to either mating connector of CX-13417.
3. RT-A cabling shown strictly for troubleshooting a power failure.
4. AM7239C/D/E cannot be connected to a LS-454 speaker.
3.2. TROUBLESHOOTING FLOWCHARTS. Continued

Long Range Radio, FIT-A
(AN/VRC-89A/90A/91A/92A)

NOTES:
1. If the splitter cables (CX-13417) are not present, the loudspeaker cables (CX-13292) may be connected directly to J3 and J4, or the intercom cables (CX-13300) may be connected to J4 and to J3 via VIC interface cable (CX-13313).
2. CX-13292 and CX-13300 may be connected to either mating connector of CX-13417.
3. RT-B cabling shown strictly for troubleshooting a power failure.
4. AM-7239C/D/E cannot be connected to a LS-454 speaker.
3.2. TROUBLESHOOTING FLOWCHARTS. Continued

Long Range Radio, RT-B
(AN/VRC-92A)

NOTES:
1. If the splitter cables (CX-13417) are not present, the loudspeaker cables (CX-13292) may be connected directly to J3 and J4, or the intercom cables (CX-13300) may be connected to J4 and to J3 via VIC interface cable (CX-13313).
2. CX-13292 and CX-13300 may be connected to either mating connector of CX-13417.
3. RT-A cabling shown strictly for troubleshooting a power failure.
4. AM-7239C/D/E cannot be connected to a LS-454 speaker.
3.2. TROUBLESHOOTING FLOWCHARTS. Continued

Chart 1

VAA CB1 TRIPS WHEN SET TO “ON”.
(Sheet 1 of 2)

NOTES:

1. If a control-monitor is not installed, go to the next step.
2. If your system is an AN/VRC89A, 90A, 91A, or 92A, the RT-A PA can trip the circuit breaker. Remove PA and set CB1 to ON and try again. If problem clears, RTA PA is bad.
3. If your system has LS-671 loudspeakers, set VAA to LOCAL mode and remove all cables from MB J3/J4. Set CB1 to ON. If problem clears, go to:

4. If your system has RT-B PA mount, disconnect cable from J2. If problem clears, go to:

5. • filled-in indicates male connector
○ not filled-in indicates female connector

CHAPTER 4
CABLES

4.1. TROUBLESHOOTING CABLES.

a. General. Troubleshoot cables as an integral part of any radio system. The VIC interface cable (CX-13313) and splitter cable (CX-13417) contain some components which cannot be checked with the test equipment available to the unit maintainer. Other cables that cannot be repaired at this level are: CX-13310, CX-13311, and CX-13312. These cables must be sent to DS Maintenance to be completely tested.

NOTE
Paragraph 4.2 Cable Schematics, provides additional details regarding cable pins, connections, and shielding.

b. Testing

(1) Continuity Test Procedure:

(a) Disconnect cable from system being checked.

(b) Set Multimeter (1) for continuity check (lowest ohm range).

(c) Connect one test lead (2) to pin of connector (3) to be tested.

(d) Connect other test lead to same pin of other connector (see Cable Schematics for details).

(e) Cable is good if Multimeter (1) reads ZERO/short. Cable may be defective if Multimeter reads other than ZERO/short; inspect for breaks, bad pins, loose connections, but do not attempt to repair cables.

(f) Replace faulty cable with a new or known good one.
4.1. TROUBLESHOOTING CABLES. Continued

(2) Short to Ground Test Procedure:
(a) Disconnect cable from system being checked.
(b) Set Multimeter (1) for continuity check (highest ohm range).
(c) Connect one test lead (2) to each pin, of connector (3), one at a time.
(d) Connect other test lead to outer casing of connector (see Cable Schematics for details).
(e) Cable is good if Multimeter reads INFINITY/open. Cable may be defective and must be replaced if Multimeter reads other than INFINITY/open.
(f) Repeat steps (c) and (d) until all pins have been checked.

(3) Short Pin to Pin Test Procedure:
(a) Disconnect cable from system being checked.
(b) Set Multimeter (1) for continuity check (highest ohm range).
(c) Connect one test lead (2) to each pin, of connector (3), one at a time.
(d) Connect other test lead to another pin.
(e) Cable is good if Multimeter reads INFINITY/open. Cable may be defective if reading is other than INFINITY/open (see Cable Schematics); if pins are not connected, replace cable.
(f) Repeat steps (c) and (d) until all pins have been checked.
4.2. **SCHEMATICS.**

5.1. INSPECTION PROCEDURES.

The following chart shows, by radio system component, those items which should be inspected as a normal step in the maintenance process. Inspection consists of making those checks shown in the right column plus such other checks as the unit maintainer deems appropriate. Subsequent paragraphs provide guidance concerning replacement and repair of components. It should be noted that inspection requirements are in addition to checks made through application of the Operational Check and related use of Troubleshooting Flowcharts.

5.2. COMPONENT REPLACEMENT.

The following charts show by radio system component, those actions required to remove and install each component. These charts cover all components of a long range, dual radio system (AN/VRC-92). Skip any component that is not a part of the system being worked on. The component that needs to be replaced will be identified by inspection, as noted above, or through application of the Operational Check and related Troubleshooting Flowcharts. A general rule is to remove only those components that are required for maintenance.

**WARNING**

REMOVE vehicular power from Mounting Base connector J1 before removing or replacing components. If vehicular power is not removed, some connectors will have 22 to 32 V dc present.

In replacing an LS-671 Loudspeaker, disconnect cable from Mounting Base connector J3 or J4. If cable is not disconnected, there will be 22 to 32 V dc present at pin B of the open cable connector.

**CAUTION**

DO NOT under any circumstances remove component covers or remove modules from components. Opening components in the field will destroy them.

DO NOT tilt or twist the RT when removing it from, or replacing it in, a vehicular amplifier adapter (VAA) to avoid damaging the connectors. The RT must be flat on the shelf and all the way to the left side when mating the connectors.

5.3. COMPONENT REPAIR.

The following charts show, by component, those items to be repaired at unit maintenance and those actions required by the Unit Maintainer to accomplish authorized repairs. While this paragraph contains instructions for complete disassembly of some components, Mounting Base MT-6352 series for example, the extent to which the Unit Maintainer will repair such items depends primarily upon unit SOP and maintenance policy.

The Antenna Connector J1 of the RT front panel is being changed from a DS to a unit maintenance task. The change requires application of a Modification Kit by DS Maintenance. Once the modification is installed, the brass-colored J1 connector will be replaced by a silver-colored connector. When it becomes necessary to replace a silver-colored J1 connector, that task is a unit maintenance responsibility. Replacement of brass-colored J1 connectors continues to be a DS maintenance task, performed only when the item is damaged. This paragraph provides instructions for replacement of the silver-colored connector.

### a. RECEIVER-TRANSMITTER (RT) (RT-1523 SERIES):

<table>
<thead>
<tr>
<th>MAINTENANCE REQUIREMENT:</th>

APPENDIX B

MAINTENANCE ALLOCATION CHART

(SEE TM 11-5820-890-20-2)
APPENDIX C
EXPENDABLE/DURABLE SUPPLIES AND MATERIALS

SECTION I
INTRODUCTION

C.1. SCOPE.

This listing is for informational purposes only. It does not give the authority to requisition the listed items below. These items are authorized to you by CTA 50-970, Expendable/Durable Items (Except Medical, Class V, Repair Parts, and Heraldic Items), or CTA 8-100, Army Medical Department Expendable/Durable Items.

C.2. EXPLANATION OF COLUMNS.

a. Column (1)-Item Number. This number is assigned to the entry in the listing.

b. Column (2)-Level. This column identifies the lowest level of maintenance that requires the listed item.
   
   C - Operator/Crew
   O - Unit Maintenance

C.3. National Stock Number. This is the National Stock Number assigned to the item: use it to request and requisition the item.

d. Column (4)-Description. Indicates the Federal item name. The last line for each item indicates the part number.

e. Column (5)-Unit of Measure (U/M). Indicates the measure used in performing the actual maintenance function. If the unit of measure differs from the unit of issue, requisition the lowest unit of issue that will satisfy your requirements.

Recommend that the installation antenna alignment procedure be changed throughout to specify a 2° IFF antenna lag rather than 1°.

**REASON:** Experience has shown that with only a 1° lag, the antenna servo system is too sensitive to wind gusting in excess of 25 knots, and has a tendency to rapidly accelerate and decelerate at turns, causing strain to the drive train. Hunting is minimized by adjusting the lag to 2° without degradation of operation.

**Item 5, Functional column. Change “2 dB” to “3 dB”**.

**REASON:** The adjustment procedure for the TRANS POWER FAULT indicator calls for a 3 dB (500 watts) adjustment to light the TRANS POWER FAULT indicator.

**and new step f.1 to read, “Replace cover plate removed in step p. above.”**

**REASON:** To replace the cover plate.

**Zone C 3. On J1-2, change "+24 VDC" to "+5 VDC".**

**REASON:** This is the output line of the 5 VDC power supply. +24 VDC is the input voltage.
